**Tags:** Complement, Disjoint, Partition, Universal, Venn

Cornell Notes	Topic: 1.2 Set Representation and Manipulation	Course: BSc Computer Science
		Class: Discrete Mathematics-Lecture
		Date: October 14, 2019
Essential Question:		
What is the visual representation of a set and on the other hand how can the said set be manipulated and partitioned?		
Questions/Cues:		
<ul style="list-style-type: none"><li>• What is the universal set?</li><li>• What is a Venn Diagram?</li><li>• What is a compliment of a set?</li><li>• What is the union of a set and its complement?</li><li>• What is the Venn Diagram Representation of the union, intersection, set difference and symmetric difference of two sets?</li><li>• What are De Morgan's Laws?</li><li>• What is De Morgan's first and second law?</li><li>• What is the Set identity of Commutativity?</li><li>• What is the Set identity of Associativity?</li><li>• What is the set identity of Distributivity?</li><li>• What is the partition of an object?</li><li>• What are disjoint sets?</li><li>• What is the partition of a set?</li></ul>		
Notes		
<ul style="list-style-type: none"><li>• Universal Set = set containing everything, denoted by <math>U</math></li><li>• Venn Diagram = to visualize possible relations among collection of sets</li></ul>		

$U$  is called the universal set and it contains everything.  
 $A \subseteq U$  ( $A$  is in red).

- Given  $A$ , Complement of  $\overline{A}$  = contains all elem. in  $U$ , not in  $A$ 
  - $\overline{A} = U - A$
- $\overline{A} \cup A = U$

- De Morgan's Laws = how math statements and concepts related through their opposites
  - In set theory, DMLs' relate to intersection and union of set through their complements

$$\overline{A \cup B} = \bar{A} \cap \bar{B}$$

$$\overline{A \cap B} = \bar{A} \cup \bar{B}$$

$\overline{A \cup B} = \bar{A} \cap \bar{B}$   
Proof using Venn diagrams

$\overline{A \cap B} = \bar{A} \cup \bar{B}$   
Proof using Venn diagrams

- Commutativity = operation in which order of element doesn't affect result
  - $A \cup B = B \cup A$
  - $A \cap B = B \cap A$
  - $A \oplus B = B \oplus A$
  - Set difference is **NOT** commutative,  $A - B \neq B - A$

- Associativity = grouping of elements in operation, where the grouping doesn't effect the result
  - $(A \cup B) \cup C = A \cup (B \cup C)$
  - $(A \cap B) \cap C = A \cap (B \cap C)$
  - $(A \oplus B) \oplus C = A \oplus (B \oplus C)$
  - Set difference is **NOT** associative,  $(A - B) - C \neq A - (B - C)$
- Distributivity = multiplying a sum by number gives same result as multiplying each # and adding the products together
  - $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$
  - $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$

Union	Name	Intersection
$A \cup B = B \cup A$	commutative	$A \cap B = B \cap A$
$(A \cup B) \cup C = A \cup (B \cup C)$	associative	$(A \cap B) \cap C = A \cap (B \cap C)$
$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$	distributive	$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$
$\overline{A \cup B} = \overline{A} \cap \overline{B}$	De Morgan's laws	$\overline{A \cap B} = \overline{A} \cup \overline{B}$
$A \cup \emptyset = A$ $A \cup U = U$	identities	$A \cap \emptyset = \emptyset$ $A \cap U = A$
$A \cup \overline{A} = U$ $\overline{U} = \emptyset$	complement	$A \cap \overline{A} = \emptyset$ $\overline{\emptyset} = U$
$\overline{\overline{A}} = A$	double complement	
$A \cup (A \cap B) = A$	absorption	$A \cap (A \cup B) = A$
$A - B = A \cap \overline{B}$	set difference	

Show that:  $(A \cap B) \cup \overline{B} = B \cap \overline{A}$

$$\begin{aligned}
 \overline{(A \cap B) \cup \overline{B}} &= \overline{(A \cap B)} \cap \overline{\overline{B}} && \text{De Morgan's law} \\
 &= \overline{(A \cap B)} \cap B \\
 &= \overline{(A \cup \overline{B})} \cap B && \text{De Morgan's law} \\
 &= B \cap \overline{(A \cup \overline{B})} && \text{commutative} \\
 &= (B \cap \overline{A}) \cup (B \cap \overline{\overline{B}}) && \text{distributive} \\
 &= (B \cap \overline{A}) \cup \emptyset \\
 &= B \cap \overline{A}
 \end{aligned}$$

- Partition of an obj = a subdivision of obj into parts, so that parts are completely separated from each other, yet together they form whole object
- Dis-joint sets = A and B are disjoint  $\leftrightarrow A \cap B = \emptyset$
- Partition of Set = Partit. of A is set of subsets  $A_i$  of A
  - all subsets  $A_i$  are disjointed

- the union of all subsets  $A_i = A$

### Summary

In this week, we learned that sets can be visually represented by Venn Diagrams, manipulated by set identities to be simplified and subdivided into partitions to represent segments of a whole set.
